```
1 import numpy as np
 2 import matplotlib.pyplot as plt
4 def relu(x):
5
    return np.maximum(0, x)
 6 def softmax(y):
 7
    return np.exp(y)/np.reshape(np.sum(np.exp(y), axis=1), (len(y), 1))
 9 class TwoLayerNet(object):
10
11
    A two-layer fully-connected neural network. The net has an input dimension of
    D, a hidden layer dimension of H, and performs classification over C classes.
12
    We train the network with a softmax loss function and L2 regularization on the
14
    weight matrices. The network uses a ReLU nonlinearity after the first fully
15
    connected layer.
16
17
    In other words, the network has the following architecture:
18
19
    input - fully connected layer - ReLU - fully connected layer - softmax
20
21
    The outputs of the second fully-connected layer are the scores for each class.
22
23
24
     def __init__(self, input_size, hidden_size, output_size, std=1e-4):
25
26
       Initialize the model. Weights are initialized to small random values and
27
       biases are initialized to zero. Weights and biases are stored in the
28
       variable self.params, which is a dictionary with the following keys:
29
      W1: First layer weights; has shape (H, D)
30
      b1: First layer biases; has shape (H,)
31
32
      W2: Second layer weights; has shape (C, H)
33
      b2: Second layer biases; has shape (C,)
34
35
      Inputs:
36
       - input_size: The dimension D of the input data.
37
       - hidden size: The number of neurons H in the hidden layer.
38
       - output size: The number of classes C.
39
40
       self.params = {}
41
       self.params['W1'] = std * np.random.randn(hidden_size, input_size)
42
       self.params['b1'] = np.zeros(hidden_size)
43
       self.params['W2'] = std * np.random.randn(output size, hidden size)
44
       self.params['b2'] = np.zeros(output size)
45
46
     def loss(self, X, y=None, reg=0.0):
47
48
       Compute the loss and gradients for a two layer fully connected neural
49
       network.
50
51
      Inputs:
52
       - X: Input data of shape (N, D). Each X[i] is a training sample.
53
       - y: Vector of training labels. y[i] is the label for X[i], and each y[i] is
54
         an integer in the range 0 \le y[i] < C. This parameter is optional; if it
55
        is not passed then we only return scores, and if it is passed then we
56
        instead return the loss and gradients.
57
       - reg: Regularization strength.
58
59
       Returns:
```

```
60
      If y is None, return a matrix scores of shape (N, C) where scores[i, c] is
61
      the score for class c on input X[i].
62
      If y is not None, instead return a tuple of:
63
      - loss: Loss (data loss and regularization loss) for this batch of training
64
       samples.
65
      - grads: Dictionary mapping parameter names to gradients of those parameters
66
       with respect to the loss function; has the same keys as self.params.
67
68
      # Unpack variables from the params dictionary
69
70
      W1, b1 = self.params['W1'], self.params['b1']
71
      W2, b2 = self.params['W2'], self.params['b2']
72
      N, D = X.shape
73
